

Information Letter

- The purpose of this research is to evaluate the most suitable language model for dialogue generation among multiple candidate models.
- The participants will go through multiple sets of dialogues between a human (speaker 1) and an artificial conversational agent (speaker 2) and rank the dialogues with the overall best response quality by speaker 2. The experiment will last approximately 15 minutes.
- The dialogues are general day to day conversations. The dialogues are predefined and have been verified to contain no harmful, derogatory, or content. That said, the experiment does not pose any risk, during or after the completion of the experiment. The experiment has been reviewed thoroughly by the ethics committee of the University of Twente.
- The participant may withdraw from the experiment at any time by either leaving the website or not clicking the final submit button.
- No personal information of the participant will be collected except for basic demographic information such as age, gender, country, whose purpose is just to describe the sample of participants overall. This data will be completely anonymised and cannot be traced back to the participant.
- The completely anonymised data will be used during the research, and related publications. The entire data will be safeguarded in secure digital storage with access limited to the undersigning researcher(s). After the completion of the research and related publications, the data will **continue** to be stored in secure storage with possible access to other collaborating researchers in the future for any related research. The complete anonymisation and absence of personally identifiable information will ensure that the data cannot be traced back to the participants.
- Retention period for the research data has not been identified given that the potential future research is yet to be determined.

Information Letter (Debriefing)

- The purpose of the experiment is to investigate the impact of the amount of lexical alignment on the perceived quality of a dialogue. Lexical alignment is the adoption of linguistic terms by speakers in a conversation from each other. We have attempted to generate dialogues automatically with different amount of alignment. This research is being used to identify the best suitable range for alignment with respect to the perceived quality. The findings will be used to select the most suitable language models for generating lexically aligning dialogues.
